                                                                                                                                                                                                                                          Human Mch3-alpha (AAW15262) is an apoptotic protein and novel member of the interleukin-1-beta converting enzyme (ICE) family of cysteine proteases. Its amino acid sequence was deduced from a cDNA clone (AAT66992) obtd. from a Jurkat library. Mch3-beta (AAW15263) has also been identified that lacks the active site of Mch3-alpha. Mch3-alpha polypeptides can be produced in engineered host cells and used to treat human diseases associated with cell death, such as AIDS, ischaemic injury, neurodegenerative diseases, etc. They can also be used to regulate apoptosis and to screen for Mch3-alpha.

                                                                                                                                                                                                                Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle is internalised by tumour cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis.
                                                                                                         Sequence
                                                                                                                                      gene
                                                                                                                                                enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10
                                                                                                                                                                                                                                                                                                                                                           Disclosure; Fig 17A-B;

The CC invention is based on the use of caspase expression cassettes comprising CC encoding sequence of a proteolytic cleavage site flanked by sequences CC encoding two caspase subunits. A fusion polypeptide comprising a first CC and a second caspase subunit, separated by a cleavage site not associated CC in nature, is useful for cloning gene encoding enzymes involved in CC proteolytic cleavage. An expression cassette containing fusion CC polypeptide is used to identify a mutant cell line deficient in an CC enzyme of interest and is also useful for diagnosis and suppression of contiferation or metastases of a tumour cell characterised by CC overexpression of a polypeptide (e.g. Cathepsin B or urokinase, CC polypeptide is used in the tumour cells).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of human rev-caspase-3, uncleavable rev-caspase-3 and rev-caspase-6. The sequences can be used in the gene therapy of cancer and autoimmune diseases. The present sequence is a protein described in the exemplification of the

(I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human caspase 7 protein, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                      sequence represents a human caspase 7 example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense compounds targeted to nucleic acids encoding caspase for modulating gene expression and treating diseases associated with expression of caspase 7 in humans \cdot
                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-SEP-2000; 2000US-0659860

(I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human caspase 7 protein, which is used in an
                                                                                                                                                                                                                                                                                     Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              뫄
                                                                                                                                                                                                                              The present invention describes a compound (I) 8-50 nucleobases in clearly length targeted to a nucleic acid molecule encoding caspase 7, which expectifically hybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and cytostatic activities, and can be used in a nitisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition the expression of caspase 7 in condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a mouse caspase 7 protein, which is used in an certain continuous formation or tumour formation.
                                                                                                                                                 Query Match

                                The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent cellary infection, inflammation or tumour formation. The present example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
Best Local :
        The present invention relates to a molecule or molecular complex (I) comprising a binding pocket defined by the structure coordinates of caspase-7 amino acids 234, 235, 237, 276, 278, 281, and 284 or a homolo of (I) with a binding pocket having a root mean square deviation from t amino acid backbone atoms of not more than 1.5 Angstrom, where (I) has $4$ binding region that is more hydrophilic than that of caspase-3. The present sequence is caspase-7, which was used in a sequence homology alignment.
                                                                                                                            Molecule or molecular complex used for drug discovery, comprises a binding pocket of caspase-7 or a homolog having an S4 binding region more hydrophilic than that of caspase-3 -
                                                                                                                                                                                                                                                                                                                                                            Caspase-1; caspase-3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches 148;
The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase (I) has antiinflammatory and cytostatic activities, and can be used:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                not include the QACRG active site pentapeptide sequence of Mch3-alpha. Mch3-beta polypeptides can be produced in engineered host cells. They can be used as dominant/negative inhibitors of apoptotic Mch3-alpha to treat or reduce the severity of diseases characterised by increased programmed cell death, such as AIDS, ischaemic injury, neurodegenerative diseases, etc., and can also
                                                                                                                                                                                                                                                                                                                                                                                                      WO200222640-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cholesterol disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human caspase 7 protein sequence SEQ
                                                                                                                                                                                                                                                                                                   11-SEP-2000; 2000US-0659860
                                                                                                                                                                                                                                                                                                                                 10-SEP-2001; 2001WO-US28232.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the CPP23beta or Glu190 isoform of the control of inactive CPP32 proenzyme (a member of the interleukin converting C enzyme/pro-apoptotic protein CED-3 family of cysteine proteases of cunknown function cloned from Jurkat cells), the proteolytic product of which is the poly(DP-ribose) polymerase (PARP) protease.

C apopain. The PARP cleavage enzyme was purified from the human c monocytic leukaemia cell line, THP-1, using standard ion exchange chromatography techniques and SDS PAGE. Apopain can be used to c identify apopain activity modulators, while apopain encoding DNA C may be used for apopain production or in gene therapy (i.e. in vivo c rex vivo gene transplantation) for enhancing the pro-inflammatory cor pro-apoptotic effects of apopain. Anti-apopain antibodies and c of apopain activity is beneficial in the treatment of immune.
